- Dr. Lewis

HW 01 - Nonlinear Systems Simulation:

1. Duffing's Equation
2. Lozenz Attractor Chaotic System
3. Voltera Predator-Prey System

Van der Pol Oscillator:

Duffing’s equation is interesting in that it exhibits bifurcation, or dependence of stability properties and number of equilibrium points on a parameter. The undamped Duffing equation is * $$ \dd{x} + \alpha x + x^3 = 0 $$. a.0)=0.2 $$ as initial conditions. # ITEM1 # ITEM2 * Plot $$ y(t) vs. t . $*Plotthephaseplaneplot$ y'(t) $vs.$ y(t) $$.

```
Error updating Text.

 String scalar or character vector must have valid interpreter syntax:
$$ as initial conditions. # ITEM1 # ITEM2 * Plot $$

Error updating Text.
```

```
String scalar or character vector must have valid interpreter syntax:
$$ \dd{x} + \alpha x + x^3 = 0 $$
